ABC News: Al, Bandwidth and Compute in the Last Week

Summary

We share salient articles in the last week specific to AI, Bandwidth, and Compute that are important and/or merely interesting as it relates to key secular themes.

In the consumer CPU world Intel officially introduced the 14th gen Raptor Lake "Refresh" in desktops which replaces last year's version. Investors may recall our commentary last month that for some unknown reason Intel decided not to introduce a desktop version of the new Meteor Lake (coined the most significant innovation in 40 years), and so now we have Intel still unable to unseat AMD in high-end gaming.

In the middle of the desktop CPU market Intel and AMD do trade blows which is at the cost of massive power dissipation for Raptor Lake (over 50% vs. AMD at peak), which is due in part to Intel still using its tweaked 10nm process or Intel 7. Still, it is quite impressive Intel has extracted so much from its 10nm process node.

Intel's notebook Meteor Lake will launch on December 14th which given the flux in that product's execution in 2023 likely means consumers can order these platforms.

AMD's MI300X Launch - On the GPU AI accelerator front, we expect AMD to formally launch the chiplet-based MI300X before year-end and based on what we see it will be much more competitive to Nvidia's Hopper than observers believe particularly in inference workloads.

AMD's use of chiplets we note is likely the most important reason the company has wreaked havoc to Intel's CPU roadmap, and we see as being important in competing with Nvidia. Note, Nvidia has yet to offer a chiplet roadmap which we know is coming, but AMD here has years of expertise in our opinion. The MI300X also has a significant HBM3 advantage of 192 GBytes which helps AMD offer over 2x the memory density and over 1.5x memory B/W than Hopper. Look for AMD to position MI300X as a TCO-centric solution.
